

RMD Weather Report

05 December 2025

SOUTH AFRICA

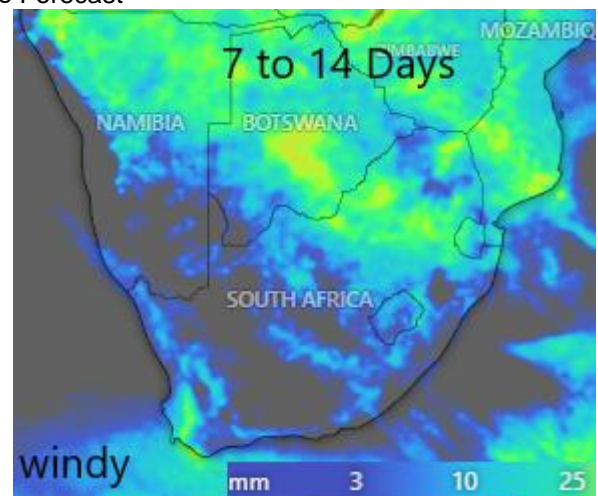

The Next Week's Forecast

INTERIOR REMAINS WET

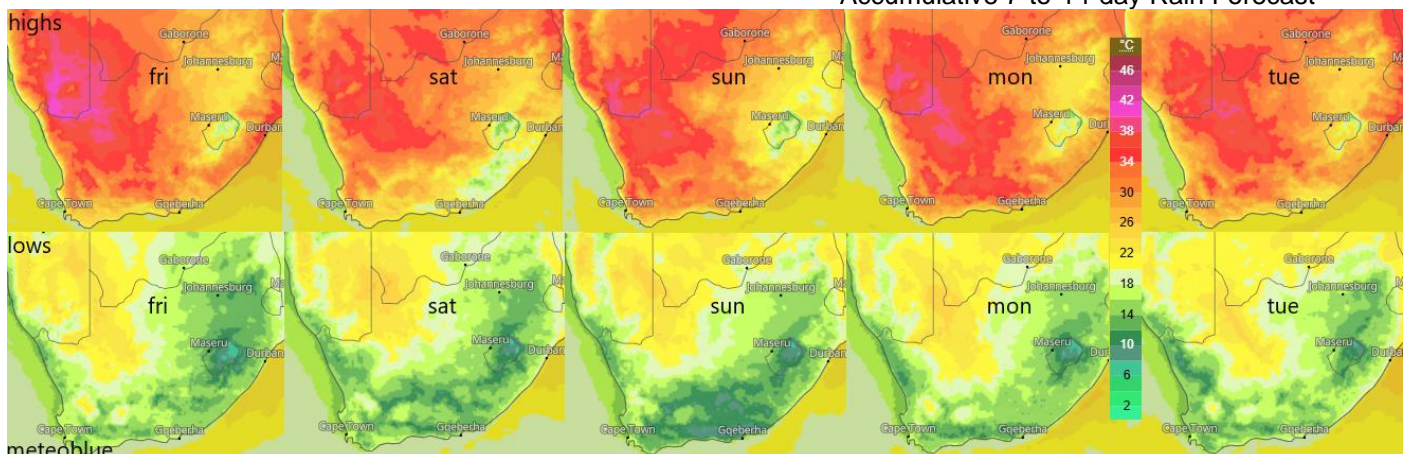

This weekend, isolated thunderstorms are expected across parts of the eastern interior (see image above).

The summer crop regions will stay wet over the 7–14-day period, with frequent storms showing up on the forecast maps (image on the right).

Meanwhile, cooler-than-normal temperatures will persist across the eastern interior through the weekend and into early next week (images below).

Accumulative 7-to-14-day Rain Forecast

5-Day High and Low Temperature Forecast

North America

Midwest Clipper Pattern

Clipper systems will bring streaks of snow, breezy winds, and cold air pushes through next week. Brief warmer spells may occur between them, with some southern snow melt. Precip won't dent drought much but will boost northern snowpack.

Central/Southern Plains: Glancing Cold, Then Warm

A front brings showers to the Southern Plains Thursday; another system with light precip and a cold front hit this weekend. Warmer air follows next week, but a strong cold front mid-week could briefly chill things before warmth rebounds—though colder air may dominate late month.

Northern Plains: Temperature Swings

Ongoing cold reinforcements via systems/fronts through next week, with occasional warmer intrusions. Snow every few days will build snowpack.

Mississippi River: More Rain Needed

Recent Midwest snow will slowly feed the system. Thursday's southern heavy rain won't lift levels much. Forecast lacks big precip, so expect gradual water level drops over the next two weeks.

South America

Central Brazil: Much-Needed Rain

A stalled front is delivering scattered showers and heavy rain, boosting soil moisture for flowering soybeans. Models align on this. Southern areas remain favourable but are slowly drying due to less frequent rain—broken by weekly showers, including another front Monday-Tuesday.

Argentina: Rain in a Drier Phase

Dry through the week; patchy showers arrive via next front this weekend. Heavy rains between dry spells create variable conditions for developing corn/soybeans, but soil moisture stays mostly favourable nationwide.

Other Regions

Western Europe: Active Pattern Continues

Frequent Atlantic systems will keep rain coming through next week, favouring NW Europe and especially Spain (good for vegetative winter wheat). Most areas remain in good shape as wheat heads into dormancy.

Black Sea Region: Drought Lingers

Recent systems have helped Ukraine and NW Russia, but large deficits remain, especially SW Russia. Only limited showers past week and through next week. Mild temperatures have delayed dormancy, but it's finally starting nearly everywhere as colder air arrives.

Australia: Drier Weather Aids Harvest, Worries Emerging Crops

Dry pattern favours wheat/canola harvest and planting of cotton/sorghum. Limited eastern showers next week: overall theme is dry. Soil moisture trending lower for newly planted cotton and sorghum.
