

RMD Weather Report

26 June 2026

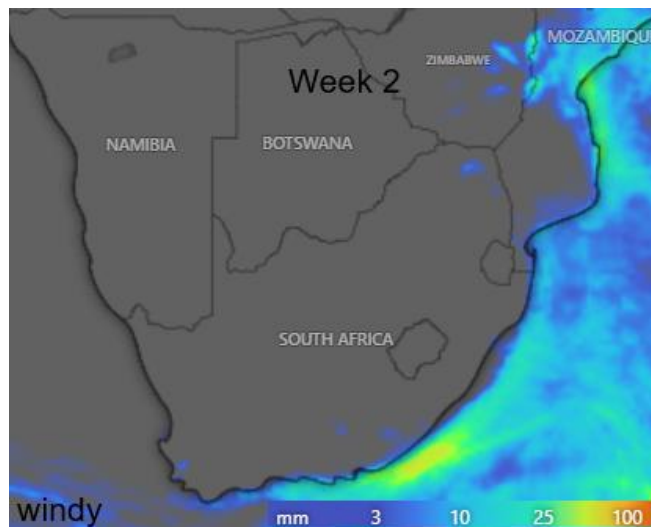

SOUTH AFRICA

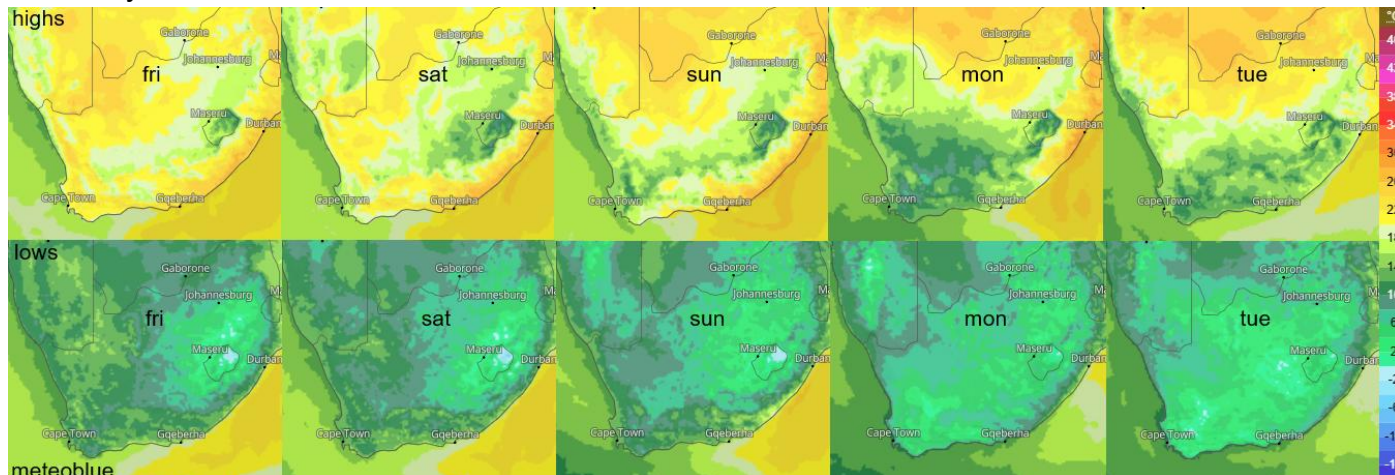

Precipitation Forecast Week 1

The Next 7-Days

A Cold Western Front push into Northern Cape, southern Namibia and Botswana with possible rain during the next 48 hours. A stronger frontal event arrives late Sunday in the Cape, bringing rain to the southern coast and adjoining areas early next week. By the end of next week, another southern front spreads showers across southern and eastern coastal areas. Inland regions remain largely dry, with only passing coastal fronts through the week. Overall, conditions favour limited rainfall outside coastal belts, keeping most interior areas dry.

Precipitation Forecast Week 2

5-Day High and Low Temperature Forecast

USA

GETTING HOTTER IN THE MIDWEST THIS WEEKEND, NEXT WEEK

The Midwest stays active through Saturday with showers and thunderstorms, including heavy rain in the south. By Sunday, the front lifts north and ushers in hotter, humid conditions for next week. While precipitation persists, especially in the drier north, the heat should accelerate growth and reduce excess moisture. If the heat eases in early July, the forecast remains favorable overall.

SCATTERED SHOWERS FOR THE CENTRAL AND SOUTHERN PLAINS

A system brings showers and storms Thursday into Friday, with severe weather possible. A front lingers through next week but conditions trend hotter and drier, limiting rainfall. This mix supports summer crops unevenly but favours completion of winter wheat harvest.

SHOWERS CONTINUE ACROSS THE NORTHERN PLAINS

Disturbances bring showers through Friday, followed by a stronger weekend system with widespread rain and severe potential. Showers linger into next week. Cooler temperatures slow growth but keep stress low. Heat builds late next week, possibly excessive.

HEAVY RAIN RETURNING TO THE CANADIAN PRAIRIES

Scattered showers continue before a weekend storm delivers widespread heavy rain lasting into next week. Cooler temperatures slow growth, but soil moisture improves. Early July brings warmth and continued showers, favorable for wheat and canola though flooding risks remain.

HOTTER AND DRIER FOR THE DELTA

Showers persist Thursday into Saturday, then lift north. Next week turns hotter and drier, which may stress crops in dry pockets but also boost growth. Gulf moisture could spark showers later, moderating stress.

South America:

SOME RAIN MOVING THROUGH BRAZIL

Showers continue in south-central Brazil Thursday, with another front Sunday through Tuesday. Late-planted corn may benefit, but most crops near maturity. Rainfall supports winter wheat establishment.

Other:

HOT AND DRY CONDITIONS IN EUROPE

Extreme heat persists, especially in France, topping 100°F. Maturing wheat is largely unaffected, but summer crops face stress. Spotty showers offer little relief until late next week when milder air and more showers arrive, though France may stay dry.

FEWER SHOWERS, MORE HEAT IN THE BLACK SEA REGION

Russia sees frequent showers while Ukraine stays drier. Heat builds in Ukraine but spreads slowly east. A front late next week should bring widespread precipitation and milder air, aiding wheat and corn development.

SHOWERS FOR AUSTRALIA DURING BUILDING EL NIÑO

Systems bring showers across western, northeastern, and southern areas through next week. Soil moisture has improved, though frequent rainfall is unusual during El Niño. Drier impacts may emerge later in winter and spring, affecting wheat and canola.

FAVORABLE WEATHER IN CHINA

Frequent showers continue for corn and soybeans in northeast China into early July. Drier conditions on the North China Plain aid wheat and canola harvest. Overall, crop prospects remain favorable.
